

# CLARENCE VALLEY SEPTICS

**Clarence Valley Septics incorporates collection, transportation and processing of liquid wastes and industrial services from domestic, commercial and industrial activities in the Clarence Valley and Coffs Coast areas.**

## GREASE TRAP CLEANING

A grease trap is designed to trap insoluble and difficult to breakdown greases and fats before they enter the sewer system. Traps are pumped with vacuum tankers and the contents transported to our liquid food waste processing facility. Here a state of the art system removes the greases and fats forming a biosolid whilst the liquid is transformed into a reuse quality.

## SEPTIC AND EFFLUENT TANK CLEANING

The septic is a biological treatment system that makes use of the bacteria present in wastes. Even in the best circumstances septic tanks will eventually need to be pumped out due to the accumulation of solids. Pump out frequencies vary depending on a number of circumstances, however it is recommended they are cleared every 4-6 years.

## OILY LIQUIDS RECOVERY

Clarence Valley Septics are specialists in the removal and processing of oily waters. Pits capturing water from commercial and industrial wash down activities contain oil and other hydrocarbon based products. This waste water is captured in pits and separator systems before entering the sewer system. These pits need to be pumped out at regular intervals to prevent contaminants entering the sewer system.

We also collect used engine oils from commercial and industrial workshops. The oil is collected via tanker and filtered during the collection process. It is then transported and consolidated with further filtration before refining back to a base oil product.

## VACUUM EXCAVATION

Also known as non destructive digging and hydro excavation, our range of vehicles, with large and small debris capacity, use a combination of vacuum and high pressure water to trench and safely excavate around existing utilities.

## DRAIN CLEANING

High pressure jetting and vacuum equipment uses a range of rotating nozzles and root cutting blades with capacity over large distances allowing the unblocking and cleaning of all drain types and sizes with complete removal of debris and the recycling of waste water.

## BULK LIQUID WASTE.

Our range of liquid tank capacities from 10kl to 26kl can provide bulk removal solutions for septic, leachate or any other contaminated water.

## VACUUM LOADING

High velocity vacuum loading units allow for the relocation of materials such as dry or wet sludge easily and economically. Materials can be disposed of or placed in an alternative location on site.
